I have a network with DSL feed – use WatchGuard SOHO firewall, SBS2000 Server (no ISA), & 8 workstations with W2k and XP, mixed. All was great until I upgraded one box to XP Pro, SP1, tonight.

I can see everything on my LAN, connectivity and performance are great, and I can ping internally, but no Internet access from that workstation and it can't ping externally.

My ICF is definitely off and my IE Tools–Options settings are good. I have set my NIC for a static address and DHCP – no difference.

Any ideas?
