Nima,

Please provide ipconfig information for each computer.

Start – Run – "cmd". Type "ipconfig /all >c:\ipconfig.txt" into the command window – Open c:\ipconfig.txt in Notepad, copy and paste into your next post. Identify operating system (by name and version) with each ipconfig listing.

Are you running both Client for Microsoft Networks, and File and Printer Sharing for Microsoft Networks (Local Area Connection – Properties), on both computers? Do you have shares setup on both?

Are you running NetBIOS Over TCP/IP (Local Area Connection – Properties – TCP/IP – Properties – Advanced – WINS), on both computers?

Make sure the browser service is running on each computer. Control Panel – Administrative Tools – Services. Verify that the Computer Browser service is started.

>From each computer, test connectivity:

- 1) Ping the other by name.
- 2) Ping the other by ip address.
- 3) Ping itself by name.
- 4) Ping itself by ip address.
- 5) Ping 127.0.0.1.

microsoft.public.windowsxp.network\_web: Re: Remote Desktop over phonenumber (With and Without internet access)

Report success / failure of each ping (10 tests total).

>From each computer, test shares visibility (use actual name / address of each computer as appropriate):

Start – Run then:

- 1) \\ThisComputerByName
- 2) \\ThisComputerByIPAddress
- 3) \\OtherComputerByName
- 4) \\OtherComputerByIPAddress

Report visibility of shares / error displayed in each test (8 tests total).

And Nima, please don't contribute to the spread and success of email address mining viruses. Learn to munge your email address properly, to keep yourself a bit safer when posting to open forums. Protect yourself and the rest of the internet – never post your address unmunged.
