I am running IIS and SQL Server 2000 (eval copy) on my Windows XP Pro system. I have another computer networked to my computer. I would like to allow them to run asp.net (*.aspx) files from my computer. I tried typing in <http://mycomputername/localhost/myweb/default.aspx> and got a 'file not found' error.

I am pretty much self-taught and don't really understand the basics of all of this. Could someone please explain how I should set up permissions (sharing?) to allow this to work?

Thanks very much,

John
