I set up a small network of XP machines. When I try to gain access to one of the machines from the machine in my office, I get asked to supply a password in order to log on to the other machine. That machine is not set up with a password to start windows. I realize that somewhere during the setup something must have been checked which would require me to supply a password, but I do not know how to access that function. I want to be able to access that machine from my machine without having to supply a password. Any help would be appreciated.
