Hello again,

I booted all 3 in safe mode made the changes, and now both desktops can access the laptop and vice versa. The desktops cannot access each other. When I reopen HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\LSA the value on all three pc's are still showing a 1. I have no firewall programs installed, all 3 are win xp service pack 1, windows firewall is disabled. when I ran "net user guest /active:yes" it said it was completed successfully on all 3 machines. NetBIOS over TCP/IP is enabled on all 3, and all 3 can be seen in the same workgroup.

Thanks again for your time,
