There are two ways to configure wireless connection:

1. Using the software provided the built-in wireless network card.
2. Using Windows Wireless Connection Settings.

To use Windows for wireless connection, go to Control Panel -> Network Connections, right click the wireless network card icon and choose properties. From there, you should see a second tab named "Wireless Network". You can configure wireless connection there. If you don't see the tab, that means the "Wireless Zero Configuration" service is not started. You can then go to Control Panel -> Admin Tools -> Services -> Wireless Zero Configuration to start it and set it to start automatically. After that, you will see the "Wireless Connection" tag.

Hope it helps.

Martin.
