Steve,

Your problem sounds IDENTICAL to mine, with the following exceptions: I have tried to establish the vpn either using a PPTP connection, or an IPSEC tunnel using a Cisco VPN Client 4.02A software. I Believe the vpn servers at work are still Win 2k Servers; I seriously doubt they have upgraded to Win 2003 Servers yet. Work is about halfway finished migrating to Active Directory, but is still using two win2k DNS servers and two win 2k WINS servers. I am verified on the vpn servers and their domain and registered on the DNS servers. I can ping both the DNS and WINS servers, and can ping by FQDN or IP address, but not by the NetBIOS short name which should be registered and resolved by WINS. I cannot map any network resources using either \\NetBIOSserver\shareame or \\TCPIP\sharename.

I have set the IPSEC VPN connection to the TRUSTEDZONE in Zonealarm Pro, and opened pretty early everything in that zone. My work's tech support guy's suggestion was to remove Zonealarm, even tho it is required on laptops using a dialin connection!

Sorry for the logwinded email, but wanted to provide as much detail as possible. I sure would appreciate an email if you find a solution to this maddening problem.

Thanks

Steve Longmire

Houston, TX
