Most likely a DNS configuration issue. You need to have all your client PCs using only the AD DNS server for name resolution, and the AD DNS server should be forwarding all requests for names outside your AD domain to your ISP DNS server.

I've just setup a 2003 server, and installed and configured the main domain controller. I've gone to the computers and setup the domain login stuff, and the log in works fine until it gets to the 'loading personal settings' part, and hangs for 3 to 5 minutes. What's going on?
