As previously mentioned, IAS will work for you and is designed to handle wireless, VPN, LAN (802.1x) and dial up authentication. It will work if you have Active Directory in your network, or, there is an SDK that has samples for anyone to write a plug in to grab credentials out of a DB. It will also work against the local SAM (Security Accounts Manager) which is a common scenario for small businesses.

IAS is an optional component on Windows Server and can be installed via the add/remove programs applet in the control panel.

Thanks,
