Hello,

I need to change the IP address for a Windows XP Pro PC without being logged as an administrator on the local machine.

I've tried to run netsh, with administrator credentials using runas, but is not working.

I don't want to tell to the user the administrator password in order to log as Administrator. Is there a way to change the IP address for the LAN on an Windows XP Pro if the user is not member of the local admin group?

Thanks,
Bogdan
