Thanks for the advice, I had the Windows firewall and NIS personal firewall enabled on both machines, plus the firewall within the Belkin Router. I've disabled Windows Firewall on both machines, and ensured that NIS is configured to allow ip addresses of the 2 machines to work. This has improved things somewhat – on the laptop now it sees itself when I look for other workgroup computers, but still neither machine can see the other. I'm reluctant to disable firewalls completely on either machine, as I assume because both connect directly through the modem/router to the internet, both machines need their own firewall protection enabled. Can you think of anything further?
