Hi

For several weeks I have been trying to cure a problem at my neighbours house, he has two Windows XP Home pc's connected by a crossover cable so that he could share files between the two systems.

This worked fine but he kept getting spyware and the such, so I upgraded him to SP2 put on Microsofts AntiSpyware and also installed Kaspersky's virus checker.

After this I have been unable to share files, I ran the ICS Wizard and could use the internet from both pc's but cannot share files.

I can ping both ip address and computernames from both pc's but as soon as I try to connect I get the following messages.

The error when trying to access the laptop from the base is
"\\computername is not accessible. You might not have permission to use this network resource.

Contact the administrator of this server to see if you have access permissions.

Access denied"

from the laptop to the base pc the error is

"\\computername is not accessible. You might not have permission to use this network resource.

Contact the administrator of this server to find out if you have access permission.

Logon failure the user has not been granted the requested logon type at this computer."

I have also under advice tried the following commands

```
net user guest /active:yes
ntrights +r SeNetworkLogonRight -u Guest
ntrights -r SeDenyNetworkLogonRight -u Guest
```

And still am unable to get it working

Cany anybody please help

Regards

Anthony
