Chuck,

If you want to start on next "situation".

UPDATE:

1. I have the xp system(wabash1) up and running fine.

Changed a bunch of setting per your instructions and it appears OK. :-) I can see and get into all systems/files that are set up for sharing, except the one 98se(wabash2, wireless). Browstat shows 6 systems(I think) and that would be the 3x ofallon1,2,3, the server (all xp's), my xp(wabash1) and 1x 98se(wabash3).

2. The 98se(wabash3) can see everything AND get into the xp(wabash1) after I changed GUEST on the xp.

The guy next door is baulking about letting me get into his systems so I may not be able to run browstat/ipconfig on each of his machines.

He had his system set up by a tech and I guess he doesn't completely trust me. ;-)

Do you want to help me try and get the 1x 98se(wabash2) up and running? It's the one in the back office that's using the wireless connection. It can't see anything nor can it be seen. It does have internet so I know, at least, that part's working!!!

L.
