I've got your basic 10/100 network setup, with 2 hubs, one in each building. Internet is always on with a 512k adsl permanant line. There is no much activity on the network on average. Recently my desktop pc, which is a basic celeron 2.0ghz, has had a slow connection when it comes to accessing the network in the 1st click, say for example if I click on network neighborhood, it takes more than 30 seconds to open up. it used to connect directly before. I am certain that i haven't made changes to this pc network settings or installed any software that might have. I suspect that spyware may be an issue but i have spybot, ad-aware, windows spyware updates installed – basically everything that i heard was effective and installed and updated them but none has worked out in fixing the problem. I'm outta ideas! Any suggestions guys/gals?

.
