Michael,

How are the two computers connected? Do you know, for a certainty, that they are connected, reliably? One of the basic checks is whether the network cable is connected to a host (computer or other network device) at the other end, and the status lights on a desktop network card are very useful here. With a laptop, you don't get the status lights.

Please start by providing output from "browstat status" and "ipconfig /all", complete and unedited, so we can decide what to look at next.
