The window pops up and stated, "\\.....\SharedDocs is not accessible. You might not have permission to use this network resource. Contact the administrator of this server to find out if you have access permissions. The network path was not found." Is there anything I can test to ensure both computer is able to communicate to each other? When I click the folder in My Network Place. As right now I am able to access laptop's file but can't access to desktop's file.
