I followed the instructions for sharing my printer at home. I have the following wireless setup: Netgear router with 4 ether ports. My desktop is hardwired to the router. I have 2 laptops, both running XP SP2. However, one is a work laptop that logs into my work "domain". While I am logged into my work laptop into the work domain, I can't seem to see my shared printer on my home network. I figured this is due to the fact that I am logged into my work domain, not into my local laptop domain account. Is there anyway to connect to a shared printer on my home network, while in a different domain?
Thanks.
