I can't find anything called a "300+" on the D-Link web site. Is your D-Link device an ADSL modem or an ADSL router? Those are different types of devices. What is its complete model number? Examples of current D-Link model numbers are DFL-300, DI-524, and DSL-302G.

An ADSL router has two IP addresses: a static local area network address (such as 192.168.0.1), and an Internet address (probably dynamic) assigned by your Internet Service Provider.

Where do you see the 169.129.171.41 address? What tells you that it belongs to the ADSL device? That's not an address that I would expect to see on the local area connection of an ADSL router.

What is your computer's IP address? To see, right-click the local area network connection and click Status | Support. If that address is 169.254.x.x, it means that your computer isn't detecting a connection to the ADSL device.
