Thanks for the comments. I'm not technical so maybe I don't understand the question. That's my website I pay Yahoo to "host." I use their software to upload files. I create web pages and insert video files and upload the page. The video files are files I created using Adobe Premiere from video I shot. I have never required, nor do I know how to, a password. The Yahoo techs said there are no password protected files on my site. I've been posting and viewing video on this site for a year with no problems. I have user access to the site and can add and delete pages, media, anything. The only thing that is different is I put these files on my new XP and viewed them Media Center before I uploaded them and -- after I tried unsuccessfully to network my two computers. I feel that somehow in trying to network them I must have changed some setting to require a password, and that requirement has attached to these files even though I uploaded them to Yahoo's server. The same thing happens no matter which of my two computers the files come from. FYI, when I check network connections, under LAN or Internet connections, it shows

Local area connection disabled  
Local area connection 2 connected  
1394 Connection connected

(For video I have several external firewire drives.)

Which makes me think the computers think they are networked. But I have not been able to access files back and forth.

Note that when you go to

<http://www.personalpoliticalpower.com/test2.html>

and get a demand for username and password, if you hit cancel, you can see the media player and buttons. In the past, anyone could click play and the video would play.

You'll note the demand says "Enter Network Password," although this is an html page on my site. The message looks like a Windows message. But I am sure I never typed in a password for my XP so I'm baffled.

The creator of the file may have included a username/password protection to the file, to prevent unauthorized use of it. The file also may not be viewable, except through the site listed above. And may require that you create a user acct with password to view file. To access this file from the site mentioned, you need to have logon privileges
