I just replaced a computer on my home network with a brand new one, and can't seem to get rid of the \\computer name\share name is not accessible. You might not have permission to use this resource...error. I set the new computer up identical to the one it replaced: profiles, passwords, etc., but I can only access files residing on the laptop (from the desktop), and not vice/versa. Ran Network setup wizard on both machines (connect to internet through a wireless router, desktop connected directly to router, laptop connects wirelessly), and both systems show up in network neighborhood on each computer. I can access the laptop shares through the desktop & get the error 5 when trying to access desktop shares from the Laptop. Both computers have

Re: Cannot access share (error 5)

all applicable services running, NetBIOS over TCP/IP enabled, and Restrictanonymous registry settings for both are set to 0. I can ping each machine, the router, and local hosts from each machine. I am also running Norton Internet Security 2006 on both machines with the firewall enabled for my home network. Have tried disabling NIS on both machines with no effect. I have read every post on this newsgroup and tried everything to no avail. Below are the results of Ipconfig, net view, browstat & ping for each machine. I'm about at the end of my rope...It is probably something simple, but I can't find it. Please help!

Sorry about the length of this message, but wanted to get all pertinent data out there at once.

Desktop Computer (Samuels-01) Ipconfig, Netw view, Browstat & Ping:

```
C:\Program Files\Support Tools>ipconfig /all
```

Windows IP Configuration

```
Host Name . . . . . : samuels-01
Primary Dns Suffix . . . . . :
Node Type . . . . . : Unknown
IP Routing Enabled. . . . . : No
WINS Proxy Enabled. . . . . : No
```

Ethernet adapter Local Area Connection:

```
Connection-specific DNS Suffix . :
Description . . . . . : NVIDIA nForce
Networking
Controller
```

Please read this article. If this is not it, we'll explore other possibilities.

Chuck;

Thanks for the nudge. Yes the nVidia NIC did have a hidden firewall: I re-load the OS & installed the drivers but not the utility! Anyway, got the utilities installed & tried creating a firewall profile for MS file sharing (with the wizard) but still nothing. I then went ahead & turned off the nVidia fireall completely (via the software utility), rebooted & still have the same exact symptoms. Something interesting though; when I view workgroup

computers in network neighborhood from the desktop, & click on the desktop computer and try to open the shared folders drive, I get the same error! I can still see both computers and their shares from network neighborhood, can access the Laptop's files from the Desktop, but still nothing the other direction. Any other ideas?

What Operating System (name, version, edition, SP level) does each computer run?

If XP Pro, is Simple File Sharing enabled, or if Advanced File Sharing, are you using Guest authentication? What specific shares are you trying to open?

If you are trying to disable NIS, note that is not known for success.

Thanks for the help, Chuck. Actually, I resolved the issue. After hours pouring over your site, I isolated it to an IRPStack edit in the registry. Home networking is working fine now from each machine. Thanks for all the help.
