I have two computers (one WinXP, one Mac) on a home LAN, with a router and DSL access thru SBC to the internet. Using Firefox or IE6, I can access most internet sites without a problem. However there are a few sites (www.craigslist.org) which I cannot access. For these sites I get a "site unaccessible" or a timeout. Also, I can't get a ping response or do tracert to these sites.

I can't imagine what would block access to sites selectively, particularly since the problem is the same on two completely different computers. Anyone got ant ideas?
Is this a problem with my ISP?

.
