That error is usually due to a change in a fairly obscure setting caused by antivirus software. This article contains the fix for that:

<http://support.microsoft.com/default.aspx?scid=KB;EN-US;q177078>

Here is the full error message:

\\Dell-judy\H-External is not accessible. You might not have permission to use this network resource. Contact the administrator of this server to find out if you have access permissions.

Not enough server storage is available to process this command.

One other thing that might be relevant. This external drive now has a large

15 or 20 gig disk image file on it now that it didn't have before – maybe this would make it harder to display the drive over a network??

Thanks for any help. Vern

Can you give us the full error message you get when you try to access it?

Does it by any chance mention 'Not Enough Server Storage'...?

should have said I lost file sharing ability on the USB drive
over the
network – I can still see it from the other computers. Thanks
