Hi Chuck:

C3 is the one computer I am not having a problem with. It is C1 that I cannot access.

Could the problem be with the Guest accounts? Guest account is off on all three systems.

Best, CMA

CMA,

The most common problem would be a misconfigured or overlooked personal firewall, or other security component. There are several other possibilities too. Read this article with an open mind.

Since you've checked simple stuff like restrictanonymus, why not provide "browstat status" and "ipconfig /all" from each computer, so we can diagnose the problem. Read this article, and linked articles, and follow instructions precisely (download browstat!):
