I'm trying to connect my laptop, and desktop via firewire to transfer files. I've been searching for hours now, and I don't feel any closer to solving the problem. I have Windows XP MCE, and the firewire is routing through my desktop to my laptop fine, but I'm not sure how to transfer files. I used CapDVHS on the laptop to capture my local NBC station's feed which was routed through the desktop, just to be sure it was working.

I tried opening networking connections on each computer, and going to the properties of the 1394 connection, then ip properties and setting the ip to 192.168.2.1, and subnet to 255.0.0.0 on the desktop, and 192.168.2.2 on the laptop with the same subnet.'

I then went start/run //192.168.2.1 on the laptop, and it said "The network path was not found".

Maybe I'm way off track. Could someone please help?
