Unfortunately cached credential manager in XP Home will not remember passwords to Domain Resources.

The same thing happens by default on Media Center computers, but this can be changed. XP Home cannot be changed.

Hi,

Big computer companies still sell desktop and laptop computers with Windows XP Home to offices, where users suffer from it's missing ability to remember network passwords. When you try to log into any server or domain there isn't an option "remember password" as in Windows XP Pro.

That also means if one tries to connect with MSIE Windows XP Home laptop to office

Sharepoint services, one has to enter the password each time without remembering option in the "Connect to ..." user name and password dialog box.

Is there any way to add "remember password" option to Windows XP Home?
Is there any good 3rd party application which might help?

If sellers could point out this missing capability, many users had chosen XP Pro instead. Unfortunately it has turned out like a secret, which most salesman haven't ever heard about and users next option is to buy a at least full Retail XP Pro upgrade, as there isn't any other updates fro XP Home OEM version.
