Dear Chuck,

SFS is uncheck

In Security Options

Accounts: Guest account status Enabled

Network access: Sharing and security model for local accounts Classic----

User Rights assign:

Access this computer from net. Everyone, Guest.....

Deny access to this computer from the network - SUPPORT_388945A0

NetBIOS settings - Enable NetBIOS over TCP/IP and not checked Enable LMHOSTS lookup. On the other machines is set on Default and checked Enable LMHOSTS lookup.

Nothing happend. Ping works from that PC, but no one can see it. I changed the cable. Network card seems good.

The error mesagge is:

Re: Ping does not work in both directions

\\CompName is not accessible. You might not have permission to use this network resource. Contact the administrator of this server to find out if you have access permissions.

Logon failure: the user has not been granted the requested logon type at this computer.

Klara,

That's the account that you're using – it's activated, but not for network access. It's a known problem here.

<http://nitecruZR.blogspot.com/2006/01/look-at-complete-detail-in-error.html>

The error message is ... You might not have permissions to use this network resource. The network path not found. Sorry, I am confused if I made a mistake.

I visited your web site and now I do not know what to do.

I enabled Simple File Sharing, Guest account is enabled, Deny access to this computer from the networks – Guest is not on that list..... Now, I am going from the beginning. Please, do not give up on me.

Well that's different. That's a name resolution problem.

If that's not a firewall problem, then look at the node type, and the NetBT setting.

<http://nitecruZR.blogspot.com/2006/04/netbios-over-tcpip.html>

Look at firewalls, and other security components too.
