My internet connection is ADSL. No, it doesn't require a dialer or extra software, and my router is set up for PPPoE.

Regards

Steve

I have 2 pc's, both running WindowsXP – Media Centre Edition SP2 , I am the administrator on both. One is wired to a Netgear router, the other, a Netgear wireless adapter. The wireless pc has myself and 3 user accounts.

Problem is; I can access the internet but the 3 users can't! If I log on, then log off or switch users, they are able to access the internet. If they try without me having logged on first, they can't, everything else works fine.

Simple file sharing disabled, Windows Firewall disabled, Zone Alarm Pro and NAV are installed and enabled. Netgear folder is shared. Any ideas?  
Thanks

Regards

Steve

Steve,

Re: Users can't access internet

What type of Internet service do you have? Does it require a dialer or extra software on the computer? Maybe Dialup Networking? If your service is PPPoE, you should set the router up for PPPoE, and connect thru the router as the default gateway.
