I do tend to go on and on sorry about that but cutting to the chase my internet provider is saying because i use p2p it is eating all my Bandwidth and thats what is slowing my computer down but this has only happened in the past 2 weeks.I have done all the checks i can think of but still slow. I have a 2mb line.

I am having problems with my computer running slow when I run my p2p program but this has just started about a week ago. I have been running p2p for sometime now about 6 months and everything has been fine until now. So here s what I have done to try and sort it out, a complete virus scan using Norton (Updated it before I did scan) which came back ok I have run ad-aware which found 9 critical objects which where all tracking cookies in the iecache entry and 13 negligible objects type MRU List which where all removed.I also did a disk defragmenter and a disk clean up.After that I rebooted my computer only to find it still running slow when my p2p is running.I then phoned my server and he told me to goto start then run type in cmd and then type netstat and enter he then asked if there was more that one line to which there was because my p2p was running and strate away he told me I have a bug in my system and to down load a program called spybot search & destroy and run it which I did and it came back clean he then asked me to run netstat again without my p2p running which I did and there was only one line of text so his answer to this was a to backup all my data and format my hard drives and start again.I told him if I back up my files how do I know the so called bug is not in one of them? His reply was I don t have a answer to that Does anybody have any idea s how to slove this problem without doing a

Re: netstat ?????

clean
start? And also what and how can you tell whats what in netstat?

Gary,

There's a lot to answer here, not just technical issues.

To start, can you please try and write more clearly, and with less caffeine in your system. This is Usenet, not an IM program. You can write your problem report, and reread and edit it a bit before posting, and we will all be able to help you better. Here are some tips.

<http://nitecruZR.blogspot.com/2005/05/how-to-post-on-usenet-and-encourage.html#Grammar>

Having said that, I would congratulate you on not having formatted your hard drives simply because you are running a P2P program. I don't quite understand what a "server" is that would give you technical advice, but we will pass on that.

Netstat is a command line program that identifies open connections on your computer. It is normal to have open connections, when you have P2P running and when you don't. If someone tells you to reformat your hard drives simply because you have a line of text in netstat, he is not somebody who, IMHO, you should listen to.

So now back to the original problem. I would like you to read my article on monitoring your computer. It's a place to start. Then ask questions here. We'll try to help you.

Also, Spybot S&D is one program, of many, that are used to find malware. Read a bit more about alternatives please.

Just slow down, and think as you type. We will be here when you hit the Send ("Post") button. Even if you spend an extra 10 minutes proofreading.
