Posting the results of ipconfig /all and routing table here may help.

In our company we have wireless network and ethernet wired connection.

Wireless is used for internet and vpn

Ethernet wired connection is used for domain

Problem

One user connected to the ethernet tries access the domain but he wasn't able to view the domain because of the higher priority of wireless connection. It was routing the traffic through wireless connection but had nowhere to go so it gave an error network not found. I set up the metric from automatic to 10 on ethernet and Wireless 20.

But he is still having those problems? any other solution?

I tell him to disable the wireless once he is connected through ethernet but when he goes to a meeting using wireless and comes back the ethernet part stops giving error or doesn't connect automatically.

Sorry for such a long question, a lil complex problem.
