Hi there,

I have a son which comes and stays weith us sometimes like during the holidays and he uses our computer to maybe do some work or collect resources. He constantly is on the move at university and he is quite lazy when it comes to bringing his flash drive with him. I have looked up VPNs and it looks like this is the kind of solution he needs as my computer is on most of the day so using a VPN makes sense. Only problem is i have a wireless router from sky and most of the places that he is at he uses a wireless access point to connect to the internet. So when i try to connect to his computer or he tries to connect to me he cannt becuase the public IP address is for the router. How do i get this to work. It causes many problems trying to connect directly becuase the windows always connects to the router. I am a begginer to networking so could you please explain some of the technical details.
Thanx
