Hi,

Maybe someone can help me. I'm experiencing something weird.

First, here is my basic setup. I have a Linksys Router which is 192.168.1.1. I have a 16 port switch for all my computers & printers. Everything works fine.

I have another computer in the next room for which I bought an Access Point for having a wireless connection. It is 192.168.1.3.

I can ping the access point. I can ping the router. However, I cannot get past the router with this computer.

I also have a laptop which uses the same access point for wireless connection, and I can get to the internet just fine.

The network is secured. I do not understand it. I can get past the access point to the router, but that is as far as I can get with that one computer.....

Any thoughts?

Thanks!

.
