We have seen some computers work fine before they connect to the Internet or LAN. I am thinking the computer may have some spyware. Do virus and spyware scan first.

Hi All

I have a desk pc running win xp , which works fine opeing files etc.

But as soon as it is plugged into the network port the whole machine comes to a grinding halt. This is a basic workgroup network over a ADSL router.

When the laptop is plugged into the same port all is ok, so the problem is on the desktop pc. Is it a bad nic and what can I use to test for bad packets,error packets etc. Or what else can it be. Help will be appreciated.

Thanks all

Spiff
