I tried it without brackets.

I can now from my desktop browse the household wired lan while the laptop is connected to the desktop via wifi. The desktop still can't access the household shared internet connection though while the wifi usb dongle is connected though.

I have the [# hops] at 1 is this correct?
the internet goes:
xp home desktop > hub > win98 "proxy box" > adsl modem

My Bad I forgot to mention to leave out the brackets.

```
Start>run>cmd to get command prompt
then I typed in
route -p add 0.0.0.0 mask 0.0.0.0 [192.168.0.101] metric [1]
```

The reply was
route: bad gateway address [192.168.0.101]

"Bisirat Amanuel" wrote:

```
run this on command prompt:
route -p add 0.0.0.0 mask 0.0.0.0 [LAN gateway IP] metric
[# hops]
```

of course replace the brackets with correct data. Simply run
route on
command prompt to get a hint of how it works.

You are right on our lan being a 10Mbps variety.

As soon as I disconnected the link and unplugged the wifi usb dongle, Ie could load a page. How do I manually force the route (dummies guide please)

"Bisirat Amanuel" wrote:

The routing information is setup so that it will take the shortest path. So if your wifi connection runs faster than your Lan then your computer will start using the wifi connection as a gateway. I'm guessing your lan is 10 Mbps while your wifi is 54 Mbps. This will help:

I have a new laptop running x home. I have a desktop running xp home

Re: can't access wired lan at same time as wifi link

that
is
on the
household
peer-peer
wired lan.

When I
establish a
wifi
(802.11b/g)
link
between the
desktop and
laptop

I
can brows
the desktop
shared
folders from
the laptop.

But at the
same
time
my desktop
can't access
the
household
shared
internet
connection
or
lan

(which
is proxy
plus
running on
a win98
box). When
I drop the
wireless
connection
my xp
desktop can
access the
internet
connection
and lan
again.

Why is

Re: can't access wired lan at same time as wifi link

this?

The laptop
is also set
up to use a
ethernet
cable as
well.

Also while I
can access
files/subfolders
within a
predefined
"bluetooth"
folder on
my desktop
from my
laptop, I
can't use
bluetooth to
access
internet
from the
laptop.
bluetooth
does not
affect
network
connections
on
the
desktop
