Now that I sent it, I don't think it got all of the ipconfig /all from the other computer. I will be resending it.

Thanks for the feedback there. I wish you were typical of users of this forum.

So, what's the problem here? When did you first notice the problem? How long have you had this Internet service? Does the other computer not have this problem?

Let's start by looking at your DNS service. Run "ipconfig /all" and get the addresses of the DNS servers for this computer, and the other if possible.

I just wonder if you have a DNS server balance problem.

I don't know what of this information is pertinent, but I'll through it all at you and let you sift through it.

I switched from dialup to Bellsouth DSL about 2 months ago. From the start, I noticed that the new service was loading web pages more slowly than it was

Re: Fast downloads, slow browsing

doing on dialup. I had my computer side-by-side with the Bellsouth (the new AT&T—like we needed that one) technician's computer when he hooked it up. His computer was loading pages much more quickly than was mine. I asked him about it, and he indicated that it was my problem, not his.

At that time, I was using a MS wireless broadband router that was 3 or 4 years old. In search of more speed, I purchased a Linksys wireless router. I ended up having to call Linksys to set it up because they told me that the IP assigned by their router was the same IP used by Bellsouth (192.168.1.254). They had me reassign my local IP to 10.10.1.1.

The other computer was not added to this network until recently. It is connecting wirelessly through a Linksys USB antenna which came with the newly purchased router. This computer has low-speed USB ports (limiting it to 11 kbs), but still loads pages more quickly than does this one.

I ran ipconfig /all on this computer. It is showing the DNS servers as 192.168.1.254 under "Ethernet adapter Wireless Network Connection 4" (which is the connection I use), and "fec0:0:0:ffff::1%1; fec0:0:0:ffff::2%1; and fec0:0:0:ffff::3%1 under "Tunnel adapter Teredo Tunneling Pseudo-Interface."

I will reply later this afternoon with the DNS Servers from the other computer. It is next door in my office, and I've got to go teach a class right now.

Back at you soon.

kmo

OK, your computer has IPV6 aka Teredo Tunneling, to start. With XP, IPV6 is unnecessary (unless you have a client need for it).
<<http://nitecruZR.blogspot.com/2005/05/reading-ipconfig-and-diagnosing.html#IPV6>>
<http://nitecruZR.blogspot.com/2005/05/reading-ipconfig-and-diagnosing.html#IPV6>

Seeing the complete "ipconfig /all" logs from both computers MIGHT prove more useful.
