Sorry In my last post I hit the send button before answering all your questions:

What's the complete and exact error message?

\\bjp is not accessible. You might not have permission to use the network resource. Contact the administrator of this server to find out if you have access permissions.

Access is denied

Apparently and error = 5.

How recently, in the past, was share "\\bjp\bjp-c" properly accessible? What changed about that time?

Thats kind of a tough one... it may be quite a while. Possibly even before sp/2 was installed on it.

There isn't alot of reason most of the time for the rest of the network to talk to \\bjp.

bjp can be pinged but also the output of nbstat -a bjp from \\chub appears to confirm it can be contacted:

```
C:\Documents and Settings\Harry>nbstat -a bjp
```

```
Local Area Connection 2:
```

Re: No access to win XP home share

Node IpAddress: [192.168.0.1] Scope Id: []

NetBIOS Remote Machine Name Table

Name Type Status

```
-----  
BJP <00> UNIQUE Registered  
HOME <00> GROUP Registered  
BJP <20> UNIQUE Registered  
HOME <1E> GROUP Registered
```

OK, we're back to BJP running XP Home, and using Guest access only. So you say that you have

```
C:\>net user guest  
User name Guest  
Full Name  
Comment Built-in account for guest access to the  
computer/domain  
User's comment  
Country code 000 (System Default)  
Account active Yes
```

With Simple File Sharing, you can't check permissions directly. So let's try additional tools. NTRights maybe.

<<http://nitecruZR.blogspot.com/2005/05/advanced-file-sharing-tweaks-in.html>>
<http://nitecruZR.blogspot.com/2005/05/advanced-file-sharing-tweaks-in.html>

Or CACLS.

<<http://nitecruZR.blogspot.com/2005/11/irregularities-in-individual-share.html>>
<http://nitecruZR.blogspot.com/2005/11/irregularities-in-individual-share.html>

Now NBTStat tells you that you are getting NetBT name resolution for BJP (NETBIOS Name Service). It doesn't really say that you can setup a NetBT session though (NETBIOS Session Service). Nor that the other computers are going to, necessarily, use NetBT when establishing a session.
