Thanks Lem for your reply. The print server is within that range.
Should it be outside that range? I'm using WPA2 encryption.

I'm not doing anything when it happened. I woke up yesterday morning and opened the laptop and that's when I saw the error. I went in my office where the router is and saw the same thing on one of the desktops. Neither of them were in use when the error occurred. So what I did was unplug the adapter from the router for 30 secs to get another IP addy for the desktop. I was pressed for time so I didn't bother with the laptop but when I got home last night I had to do the same thing I did in the morning.

The print server's static IP should be *outside* the range of addresses assigned by the DHCP server (the router). This is why you are getting the error. So if your router assigns IP addresses 192.168.1.10-50 for ex., make the printer 192.168.1.200.

Malke

Re: IP address conflict

Ok i'll try that when I get home tonight. Thanks Malke. Another quick question for future reference.

How can find out which systems are having the conflict?

Wy

The duplicate ip address exists on the network. Hence, all of them should report an error.
