Hi

As long as he can connect safely (use your wireless security and configure his Wireless to match) it does not matter which Wireless utility is used. What ever works well is good. Just make sure that only one Wireless management is On. If both are On it would be "Quirky".
Jack (MVP-Networking).

I was just asking because maybe one might be more reliable than the other. I guess not. I told him to run only one utility at a time. Thanks a bunch.

It's not a matter of reliability, it's more a matter of features. On my machine, I have to use the Intel utility because at work they use a form of authentication/encryption that is not supported by the Windows management program but is supported with the Intel version. But in a home environment, like Jack said, it doesn't make much difference and you should just use what works.

HTH,
John
