You may want to add the PTR records. This troubleshooting may help.

nslookup non-existent domain Case Study Nslookup can't find server name for address x.x.x.x and Non-existent domain. Situation: When the workstation can't join the domain, ...

Hello, Thanks for the great suggestion. I was able to get out of the domain today and try this test. If you run nslookup, it says: can't find server name for address 192.168.1.2, no response from server, default server unknown address 192.168.1.2.

192.168.1.2 is, of course, the ip address of the DNS server and DHCP server on our domain, the SBS 2003 server.

How do I get the laptop to use another name server?

Do this command: nslookup and then yahoo.com. Do you see any errors?
