- 1) Disable firewall on computers and check again.
- 2) Some routers have wireless isolation thing where it disables file sharing check if it is turned off.

Bilbo wrote:

I am hoping someone can give me some help here.

I have a 3-computer network. All are using Windows XP SP2. Simple File Sharing is enabled on all.

Computer 1 is a laptop connected via ethernet cable to a D-Link DI-524 wireless router. This router is connected to a cable modem.
Computer 2 is a desktop, connected to the network via a wireless card
Computer 3 is a laptop, connected to the network using a PCMCIA wifi card.

I set up shares on drives on all 3 computers.

Computer 1 can "see" both of the others, and can access the shared folders on them.

Computer 2 can "see" 1 and 3, but when I try to access them, I get an error saying I don't have permission to do so.

Computer 3 can't even "see" the other 2. When I click on "view workgroup computers," I get an error message saying the workgroup is inaccessible and I don't have permission to do so."

Re: XP Wireless Network problem – been trying to fix this for days

All 3 can access the internet.

I used the Windows network setup, and still have problems. I am at my wits end.

Any help greatly appreciated.

Bistrat

Firewalls were already disabled.

No such setting on the router. When I was running Win2K on all computers, file sharing worked fine.
