Hi,

In My Network Places, I have a connection set up to a folder on a SharePoint Server site. After I boot up, I can click the folder in My Network Places from within Windows Explorer. It asks for my credentials, and then I'm in until the next reboot.

The problem is that once I've authenticated, my entire system is slowed down. I'm not sure why that is so, but I thought that an easy fix would be to disconnect (rather than having to reboot or just live with the slowness). However, I can't find a way to disconnect.

Right-clicking the folder does not produce any Disconnect option. Disconnect Network Drive doesn't work because I haven't mapped to any drives.

Any ideas?

Thanks!

.
