Hello Carey, I must say being new to the community I was excited to see a MVP responding to my question. Obviously I thought with your expertise you would be providing an answer to my problem. I don't think you read my post clearly. I am a new programmer developing a point-of-sale system. The Sales managers want to be able to check the progress of the sales people when they are dealing with the customer because that is their job. The sales people will definitely know they are being potentially monitored because they may need help in closing the deal. Believe me I am very much against the direction of an Orwellian society which the world is dangerously close to achieving that reality, albeit under the guise of terrorism. Hopefully, in the future if I post a question you can use your expertise in the area of computer technology to possibly help me. Not to be indignant, but I don't need any lessons in ethics. I'm as honest and ethical of a person you could ever be lucky enough to know.

You need to notify the employees and ask them first if its alright with them if you invade their privacy and spy on them.

John,

I must admit, when I first read your post this is what I thought you was

Re: View users working on computers in LAN

trying to achieve.

It sounds like you need something like a remote desktop viewing application that lets you monitor activity on the remote PC, which are accessed by IP address. See <http://tinyurl.com/e2xrk>
