Hi all,

I've had to change my CD drive on my machine (the old one packed in), but when the new drive is connected, the machine hangs on boot sometime after mup.sys is loaded.

The new drive is correctly recognised as by the BIOS on boot, on the secondary IDE channel. I've tried setting it to master and slave, with the same results.

Note that I do not have a functioning CD drive – so cannot use the Windows XP installation CD to boot! (Although I can share another PC's CD over the network once booted).

Any suggestions?

Thanks,

James
