"Windows can not install hardware. Corrupt or missing Driver Code 39" This is the message i get when i try to install the floppy driver to my system. This floppy drive worked up until approx 11 days ago with no problem. Then Quicken said it did not exist when i tried to backup checking. The tree view of installed devices in the hardware section show a floppy drive being installed but floppy drive icon has a yellow dot with a black astric "!" inside the dot. If i uninstall the driver the icon and dot dissappear but after closing do computer and rebooting the tray informs me tha i have new hardware, a floppy drive found. I go to the hardware wizzard and when trying to install driver is get the message this message starts with. and this is the case using different options through the F2, F8, and F12 boot screens. Would really appreciate any help. Do not really want to rebuild harddrive if at all possible no to have to. When u do that u allways loose data somewhere.
Thanks for any help or suggestion.
Doug
