Go to Start > Programs > Accessories > Communications and right-click on New Connection Wizard and select Properties. The "Target" should be "%SystemRoot%\System32\rundll32.exe netshell.dll,StartNCW" and the "Start in" should be "%HOMEDRIVE%HOMEPATH%". Double-check the Security permissions.

| Thanks for the reply Mr. Frisch.
| The device manager shows that my modem is functioning
| properly.
| I have gone to Creative.com website and downloaded and
| installed the most recent driver for my 'Creative Modem
| Blaster V.92 PCI DI5633' modem. Creating a connection is
| still grayed out in the internet connection wizard.
| Any other suggestions?
| To me this doesn't appear to be a modem problem it seems
| to be an XP problem. The modem was function perfectly in
| my Win2K Pro system and it is only since the upgrade to XP
| that I am getting a problem. I have the correct XP modem
| drivers installed. I am able to fax via the modem.
