Gary

I did not say they should be compressed. It was may be compressed.

Opening a compressed files may take longer but I am not aware that it creates any issues. Try experimenting on a folder or two using each of the two options. I have noticed that if you add an uncompressed file to a folder where folder, sub folder and files are compressed the file added remains uncompressed until you compress it.

Hope this helps.

Gerry

I know this has kinda gotten away from the Defrag problem I was having. I have an additional question regarding creating additional space on my computer. In your comment below you mentioned certain folders that should be compressed. I checked those and they are. If I compress my personal folders that I haven't work with in a while, are there any access issues that may

Re: Defrag will not complete

arise if the folder is compressed and I for some reason had to open a file in a compressed folder? Are the files in the folder compressed compressed as well?
