My ISP rebrands F-Secure and provides it to me for free on as many as three computers. However, on one of mine, it won't run due to hardware conflict. It's only a lowly 333Mhz 386 with 128MiBs of RAM and a 5.2 GIG HDD so I use free AVG. And some other firewall. Not entirely concerned about that computer though. It's basically for file storage, since I wouldn't be able to give it away. Runs Windows 98SE. Flies too! Good machine in its day.

Not to be a wise elbow in any way, but what A/V are you running? I have two (Norton on 1 computer and AVG on 3 computers). Both of them can be set to "Wait until network connections are established" before attempting to update themselves. In fact, I think AVG will wait until connected in any case.

--->

Yeah. I'm looking for something that will give me the ability to make the network connection BEFORE my anti virus does it's validation. Otherwise the virus thing balks. Thanks.

A number of activities transpire when I log on. Most notably my virus and spyware software connects to my ISP's server and downloads the days updates. However, what is happening these days is

Re: Log on Sequence: Adjustable?

the virus software is loading
before the netcard makes contact with the
ISP's server, thus an error
message received: can't connect to the
validation server. HOW CAN I
ADJUST
THE SEQUENCE OF THE LOAD?
