The fax service of win xp seems to log-on on the system as user whose account is running.

But the path to TEMP directory it takes from environment variables for system.

Not for user account. See Control Panel – System – Advanced – Environment Variables.

I were able to observe above cause I have specific config of TEMP variables and folders. There are three on my system available:

one for user, one for administrator, one for system.

Adequately the TMP and TEMP variables are set separately for above accounts. Full access privileges are assigned only to associated account. All other users have read-only access.

I can see with process monitor that while sending the fax service is accessing the TEMP folder assigned for system account, but being logged-on as the user.

Are there any start-up option for fax service enabling modification of fax service's TMP/TEMP folder ?

.
