Are there any errors in Event Viewer?

Have a look in the System and Application logs in Event Viewer for Errors and Warnings and post copies here. Don't post any more than 48 hours ago.

You can access Event Viewer by selecting Start, Control Panel, Administrative Tools, and Event Viewer. When researching the meaning of the error, information regarding Event ID, Source and Description are important.

HOW TO: View and Manage Event Logs in Event Viewer in Windows XP
<http://support.microsoft.com/kb/308427/en-us>

A tip for posting copies of Error Reports! Run Event Viewer and double click on the error you want to copy. In the window, which appears is a button resembling two pages. Click the button and close Event Viewer. Now start your message (email) and do a paste into the body of the message. Make sure this is the first paste after exiting from Event Viewer.

Hope this helps.

Laptop: Dell 6400/E1505 XP SP3

Lately I have had new problems with my laptop. The first problem was that on normal boot-up that I could not start up applications. I had not installed any new software although I had a lot of freeware and update everything as often as I can. I can trace my problems back to a 'hard shutdown' (Using 'off' under 'shutdown' then suddenly becoming impatient for it to complete the process and pressing the Power button upon seeing my g/f come out of the jetway at the airport). Multiple reboots (from 1 to 5) will eventually reach a stage which I can open any & all applications.

[Aside--Back in mid Nov I attempted to update the ATI CCC driver using a 3rd party driver (Dell *never, ever* updates their drivers or software, and ATI has updates for just about everyone except Dell, which they refer you back to them). This didn't work and since then after rolling it back I still get a ATI dialogue box on start-up stating the driver is not compatible or needs to be updated. Since it doesn't seem to make a difference, I just close the box out. I have not done anything with this since the initial attempts in mid-Nov.]
