When moving image folders from one drive or location to another, I may or may not be able to move it. After viewing an image, or working with it, I have a need to move the entire folder to another computer. When I do so, the move command moves all of the files to the new location (into a folder of the same name) but refuses to take the original folder there also. I get a popup dialog box that tells me that the images files are in use and it cannot be moved. It ends up being a hybrid move.

I end up with an empty folder in the original location and the only way I can eliminate the folder is to reboot my computer.

How can this be stopped?
