Routing to remote mapped drives is not possible as the Mapping is only local to the machine and the network doesn't understand the drive. And if you see the event reported in the eventvwr it will report as the folder being not present even though the folder is present in the machine.

But if you want to route to remote folders you can very well use UNC paths (\\<machinename>\<foldername>). Also make sure that Fax service has Full access rights on the remote folder.
